Development of Fuzzy Extractor Based on Real Numbers
Cryptology & Algorithm Laboratory
 - Fuzzy Extractor (FE) is a cryptographic algorithm that generates the same output for the input with a slight noise coming from the fuzziness of input. Typical Fuzzy data include biometric information such as a face, fingerprint, and iris. We develop FE based on real number and apply to ArcFace, which is a state-of-the-art face recognition algorithm.

Others

- **Academic Seminar** Apr 2019 - Nov 2019
“Security of Biometric Authentication”
College of Natural Science, Hanyang University
 - We investigate the security of the face recognition system (FRS) in terms of cryptography. Using MXNet based DCGAN and improved NbNet, it succeeded in restoring the image from the template of ArcFace, proving that the current state-of-the art FRS is unsafe.
